

Impacts of Observations on NCEP GODAS Analysis

Y. Xue, C. Wen, D. Behringer, A. Kumar

NCEP/NOAA, USA

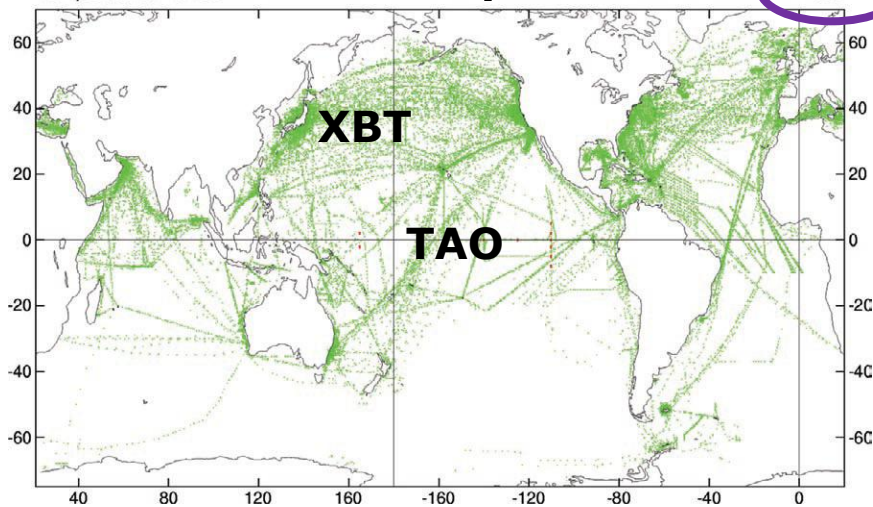

NOAA Climate Reanalysis Task Force Technical Workshop, NCWCP, May 4-5, 2015

Global Ocean Observations

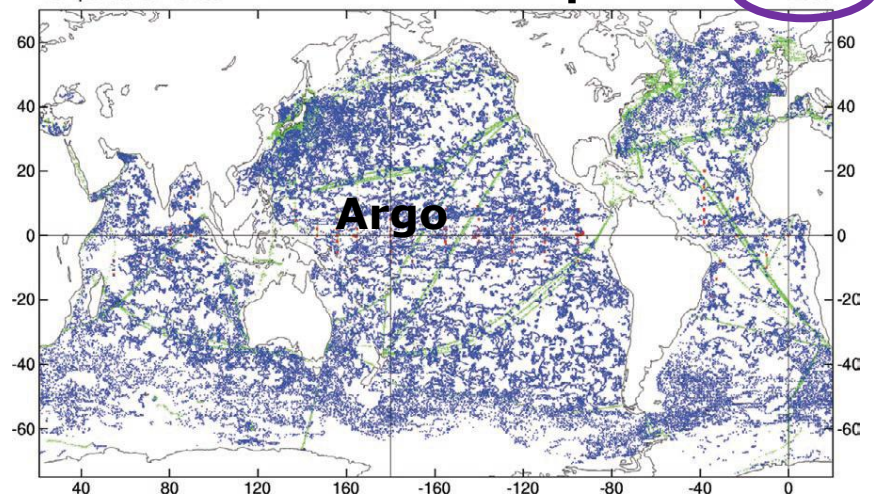

from Saha et al. (2010)

Temperature Profiles

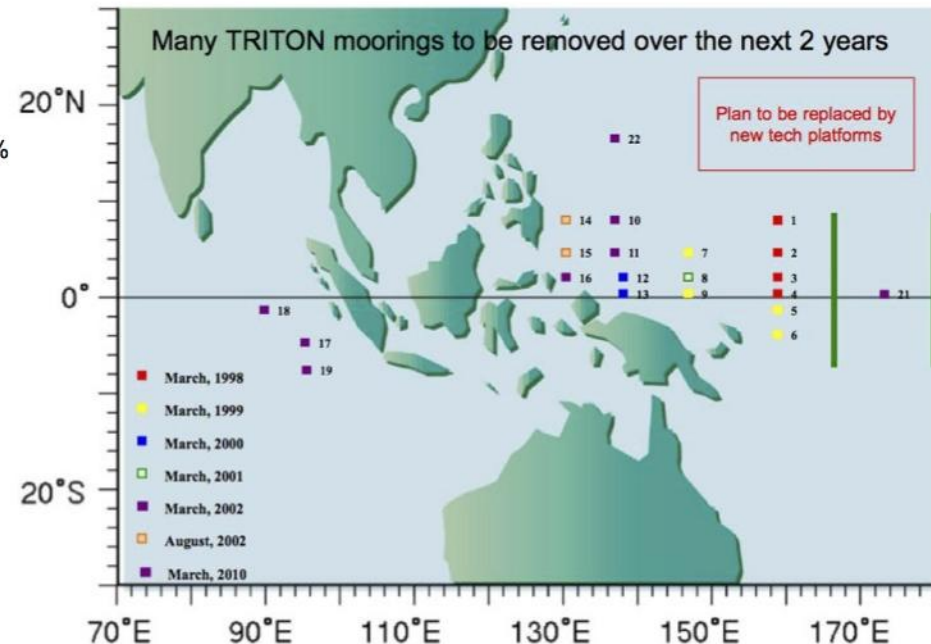

Temperature Profiles

Recent Challenges: TAO-TRITON Mooring Array

McPhaden, PMEL

Ando, JAMSTEC

- TAO data return fell below 40% in early 2014; since returned to 80%, for now.
- Around half of TRITON Moorings will be removed by mid 2015.

TPOS 2020 Workshop

27-30 January, 2014, Scripps Institution of Oceanography

- Review of observing system requirements and implementation
- Presentations on status of all aspects of system
- Presentations on potential new science and contributions
- Sponsors:

- Chaired by: David Anderson and Toshio Suga
- Report: Published April 2014 (www.ioc-goos.org/tpos2020)

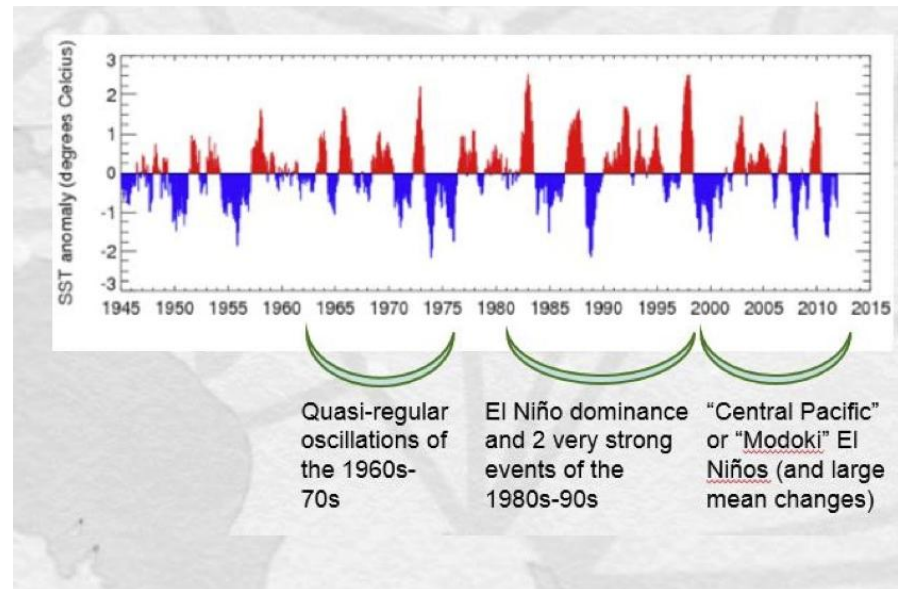

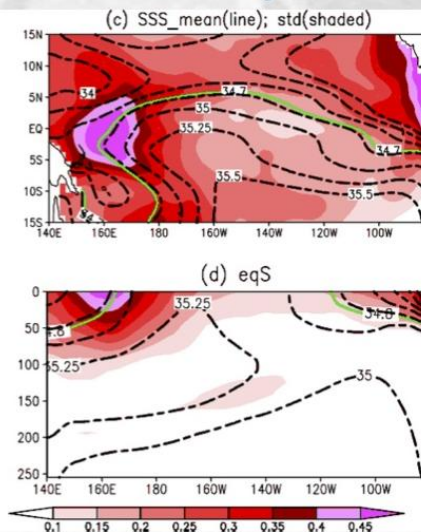

- The role of salinity
- Changes in predictability
- Evidence from systematic errors
 - To guide design, process studies, etc.
- Frameworks for sensitivity studies

Real-Time Ocean Reanalyses Intercomparison

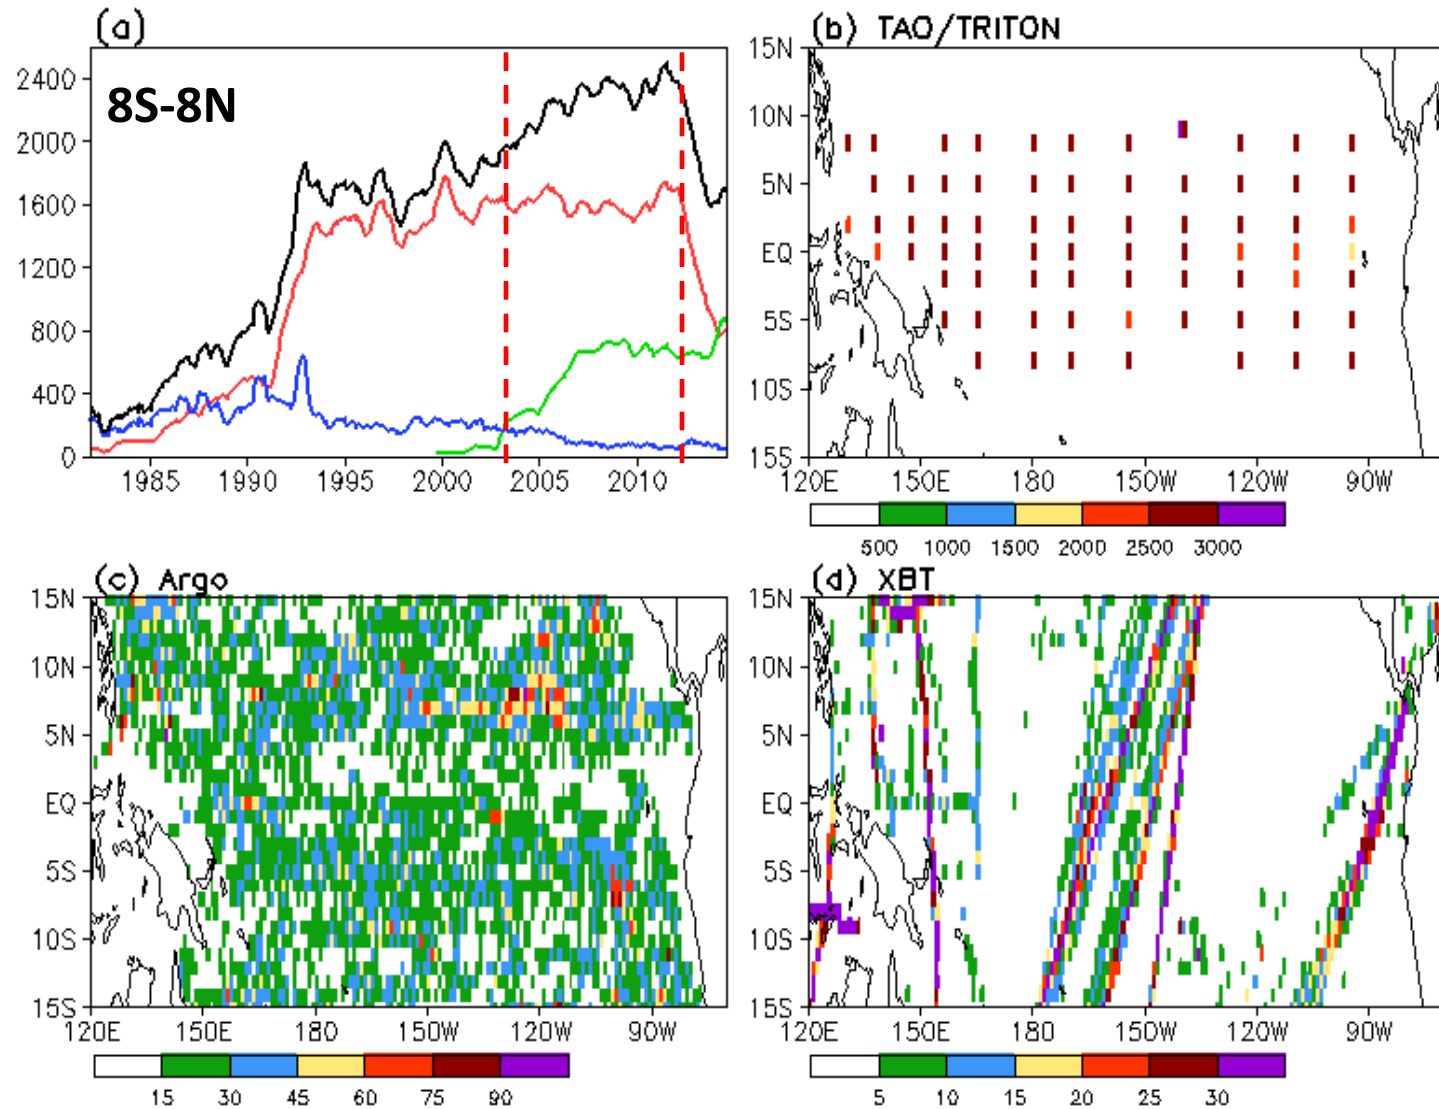

(http://www.cpc.ncep.noaa.gov/products/GODAS/multiora_body.html)

- **Assess uncertainties in tropical Pacific temperature analysis in real time for ENSO monitoring and prediction**
- **Explore any connections between gaps in TAO observations and spreads among ensemble ORAs**
- **Articulate needs for sustained and enhanced ocean observations for TPOS2020**
- **Monitor signal-to-noise ratio and climate signals associated with ENSO, Pacific Decadal Oscillation, Indian Ocean Dipole, Tropical Atlantic Variability**

Tropical Pacific Observing Systems

Black: All data
Red: TAO/TRITON
Blue: XBT
Green: Argo

Coordinated Observing System Experiments At NCEP and GFDL (2004-2011)

	CTL	ALL	noMoor	noArgo
In situ data included	no profiles	all profiles	all except moorings	all except Argo
XBT	×	✓	✓	✓
TAO	×	✓	×	✓
Argo	×	✓	✓	×

- What are the mean biases and RMSE (monthly anomalies) in the control simulations when no in situ observations are assimilated?
- How well are mean biases and RMSE constrained by assimilation of all in situ observations?
- What are influences of **withholding mooring** or **Argo data** on mean biases and RMSE?

NCEP's Global Ocean Data Assimilation System

- MOM4p1, 0.5° resolution, 1/4° in 10°S-10°N, 40 levels
- Daily fluxes from NCEP Reanalysis 2
- 3D-VAR, Univariate in temperature and salinity (Behringer 2007)
- Horizontal covariance with scale elongated in zonal direction, vertical covariance as function of local vertical temperature gradient
- Temperature profiles and OISST assimilated
- **Synthetic salinity** derived with climatology T/S relationship and temperature profiles from XBT and moorings, **observed salinity from Argo** assimilated
- **Altimetry SSH not assimilated**
- Temperature (salinity) at 5m is relaxed to daily OISST (**Levitus salinity climatology**) with 10 (30) day relaxation time scales.

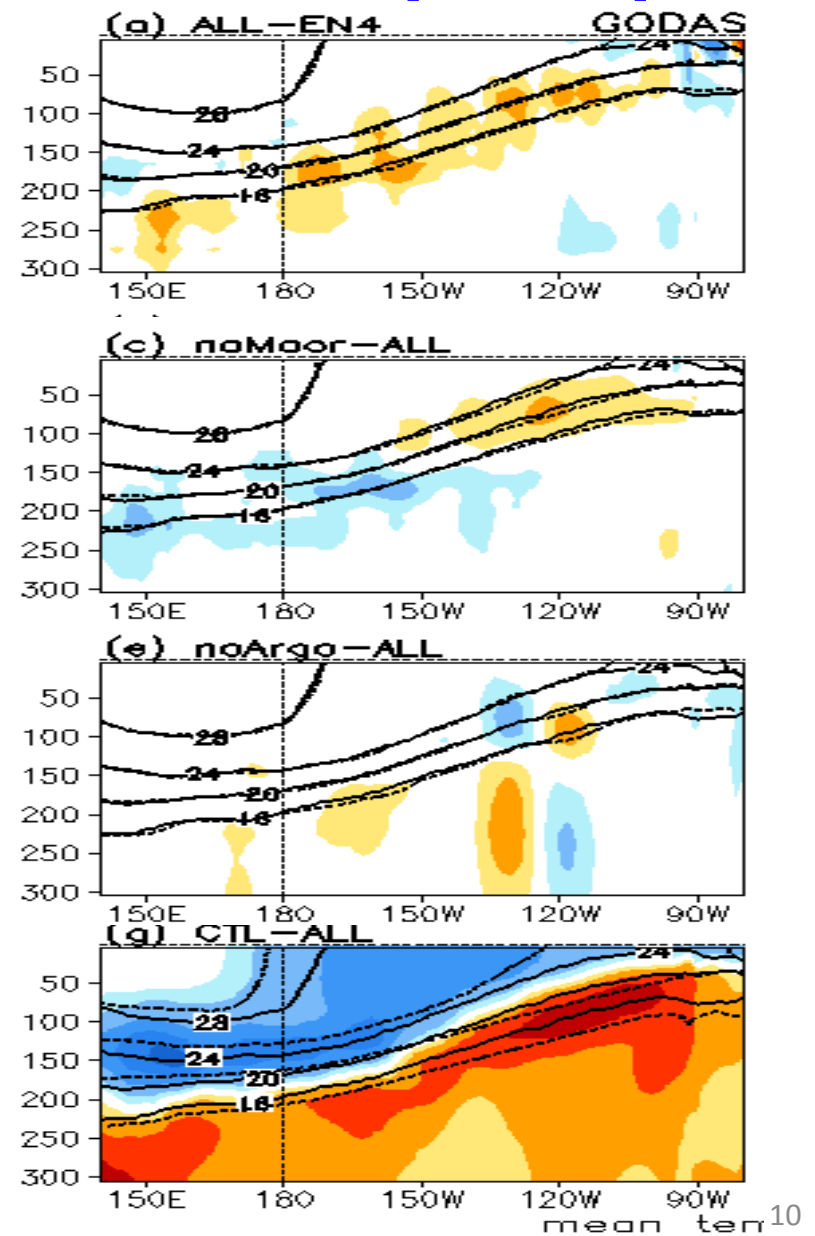

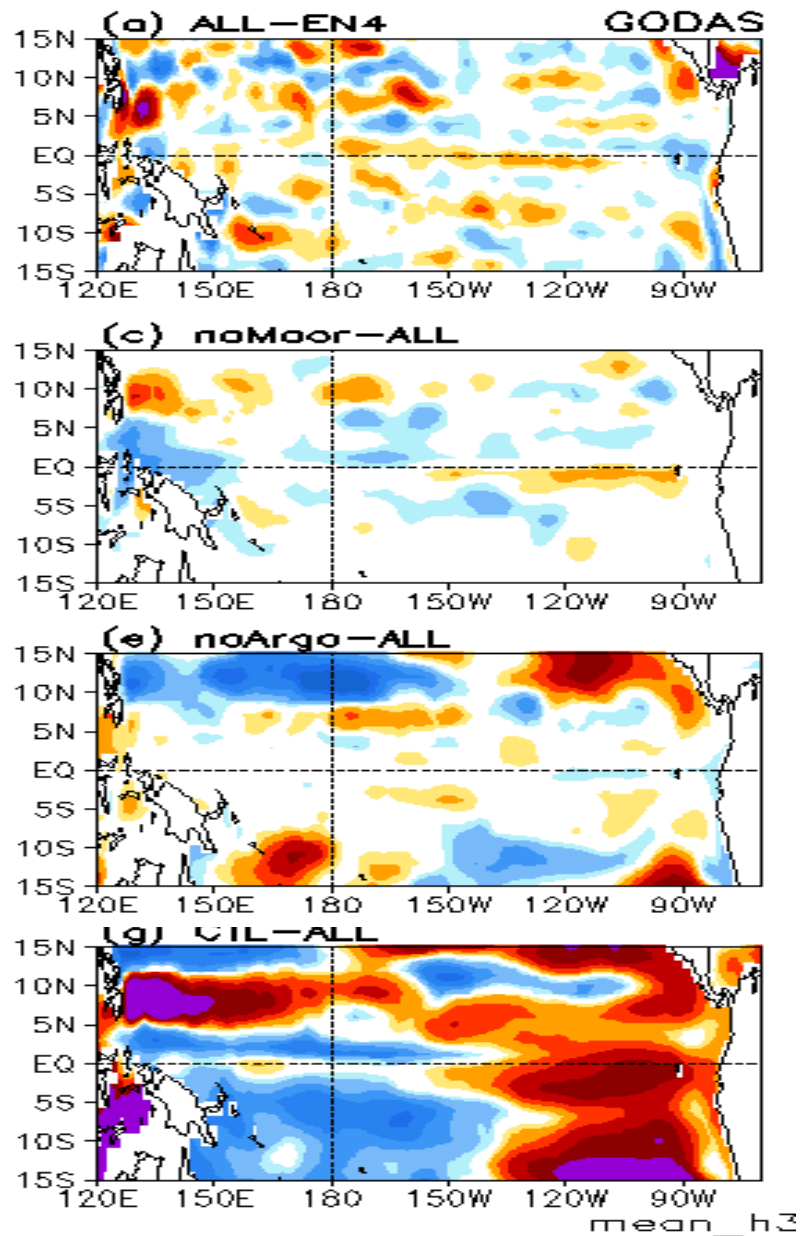

Evaluation of OSEs

- **Evaluation data**
 - TAO temperature and current
 - Altimetry SSH from AVISO
 - Surface current from OSCAR
 - **EN4 temperature and salinity analysis (objective analysis based on in situ data only) is used as reference but not the “truth”**
- **Evaluation Methods**
 - Mean and annual cycle
 - Standard deviation (STD)
 - Root-mean-square error (RMSE) and anomaly correlation coefficient (ACC)
 - Integrated RMSE in upper 300m

Salt Anomaly at z=5m in 5S-5

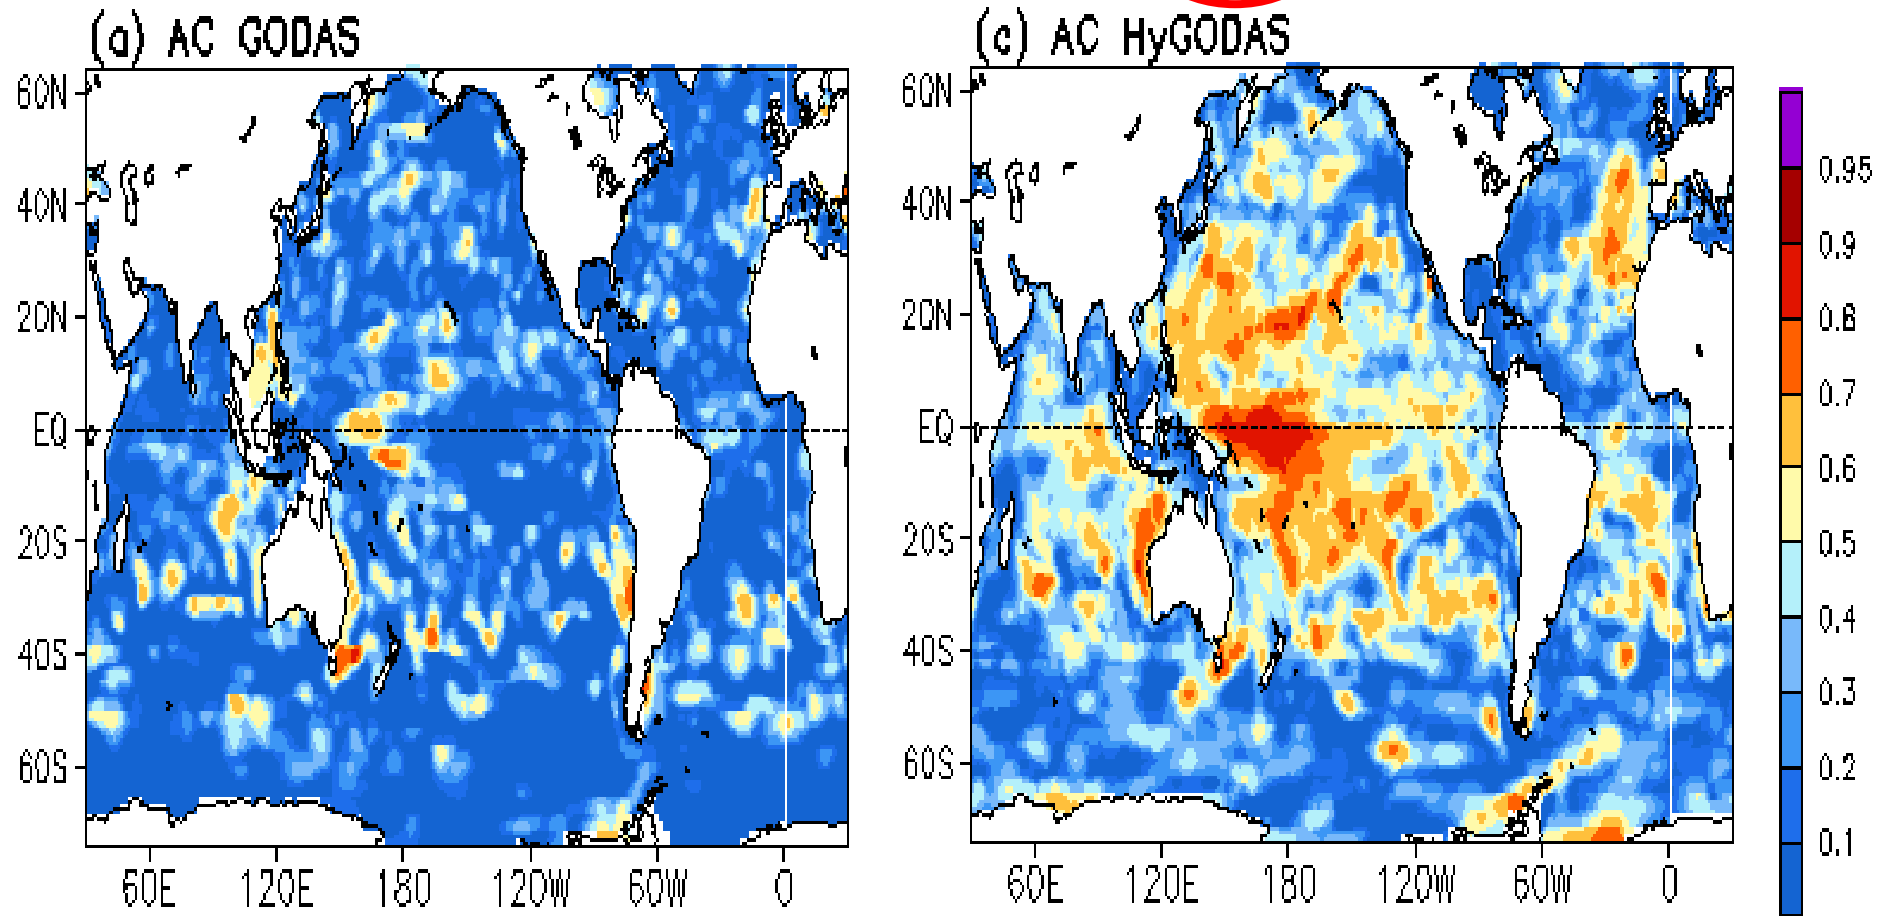

- SSS anomaly associated ENSO was well simulated by HyGODAS.

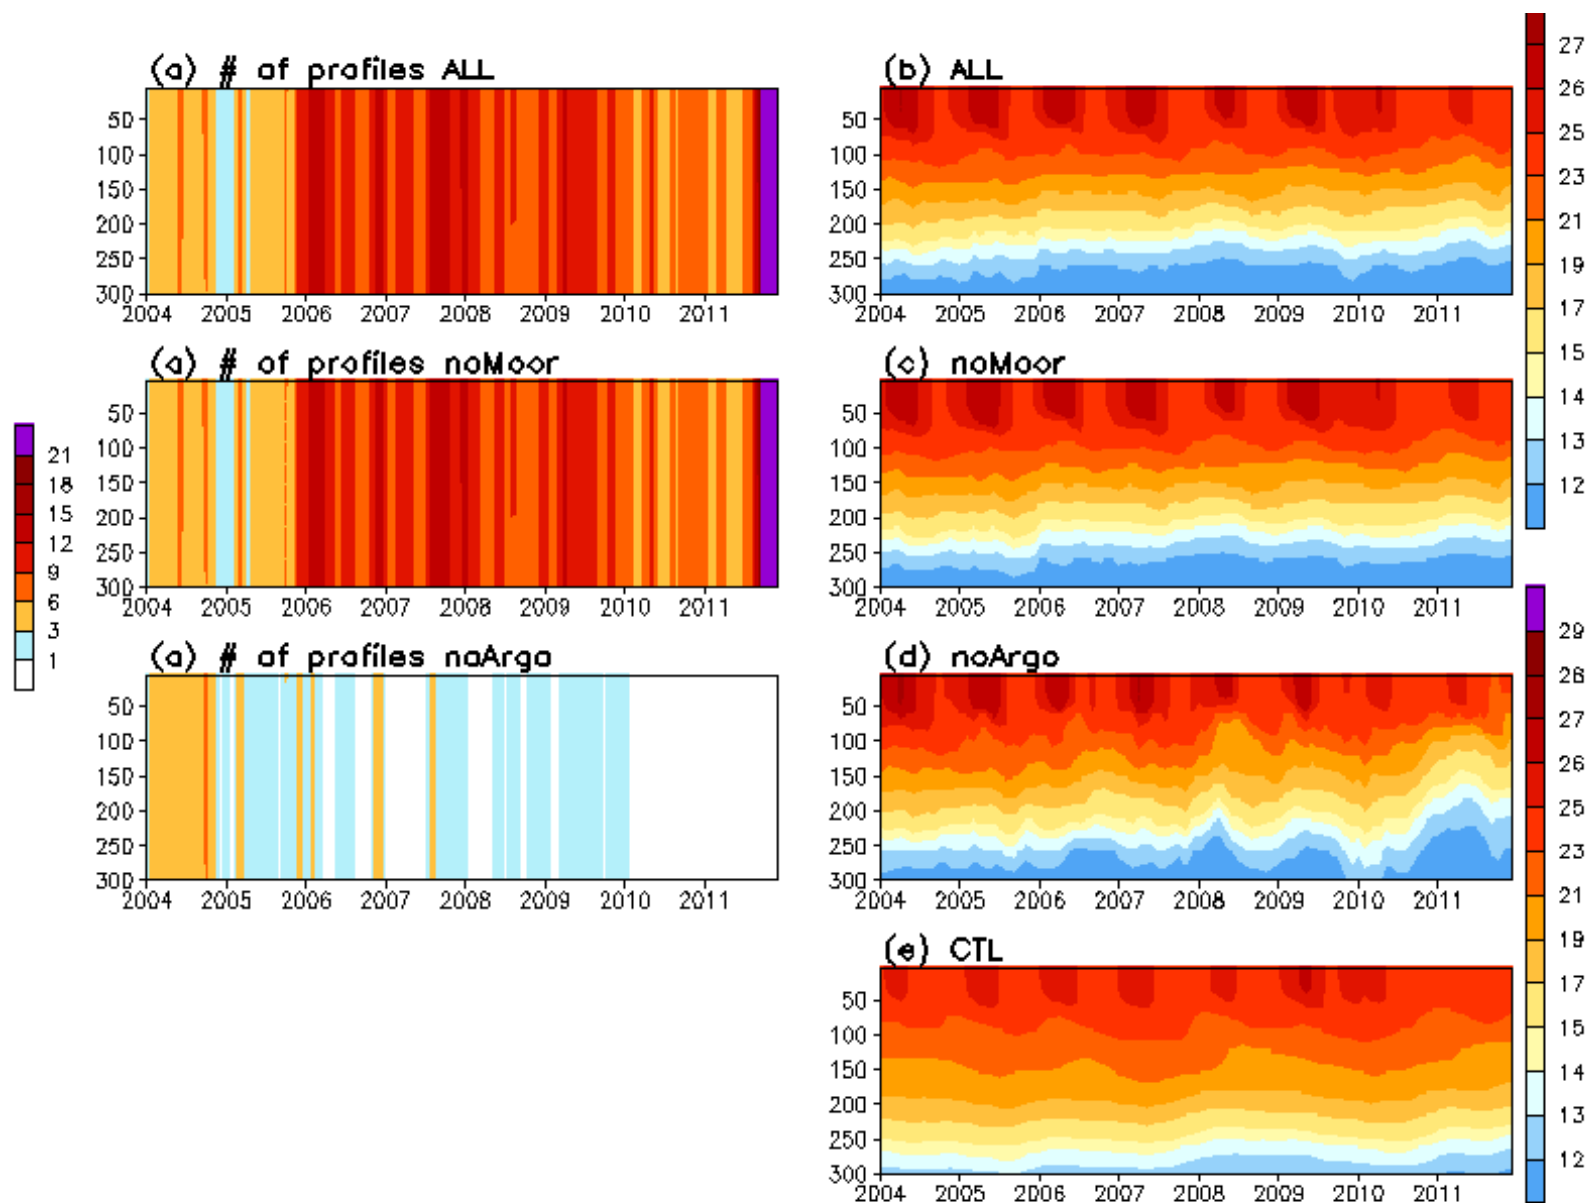

Summary

- Observing System Experiments (OSEs) were used to evaluate relative impacts of TAO/TRITON and Argo data on NCEP GODAS ocean reanalysis in 2004-2011.
- Without assimilation of any in situ data, GODAS had **large mean biases, STD biases and RMSE.**
- Assimilation of in situ data significantly reduced mean biases, STD biases and RMSE in all variables **except zonal current at equator.**
- For constraining temperature analysis, the TAO/TRITON data is more critical than the Argo data in the equatorial Pacific, but the Argo data is more important in off-equatorial regions.
- For constraining salinity, sea surface height and surface current analysis, the influence of Argo data is more critical.
- **The OSE simulations reveal several drawbacks in GODAS: 1) Without Argo data GODAS had erroneous variability in 8N-14N and 8S-15S probably due to too strong fitting to nearby TAO and sparse XBT data ; 2) salinity variability is too damped due to assimilation of synthetic salinity.**

Comparison with EN4 Salt at 5m (SSS) 1995–2011

- SSS was improved from GODAS to HyGODAS, **particularly in the tropical Pacific.**
